

Review Video on Frogs!

hello friends

welcome to a new happy learning video

today we're going to meet a very jumpy

and entertaining amphibian let us

introduce you to

[Music]

frogs

[Music]

have been on the earth for over 140

million years

and there are so many of different

shapes and colors there are big ones

tiny ones green ones red ones poisonous

ones and even some with horns there are

more than four thousand types

frogs are amphibians

and belong to the honoris family because

they do not have a tail they have smooth

moist skin and their limbs are usually

very long which is why they are

excellent jumpers

they can jump up to

30 times their size

like all amphibians frogs are oviparous

they are born in the water

their mothers lay thousands and

thousands of small eggs in ponds look

here you can see them

[Music]

as time goes by these eggs are

transformed into tadpoles that don't

look anything like their parents right

as you can see they have a long tail

which helps them to move nimbly through

the water and they breathe through the

gills just like fish

but little by little the tadpoles

undergo metamorphosis that is to say

their bodies are constantly changing

they grow legs they lose their tails and

they get much bigger

here you can see the phases of

metamorphosis in reality isn't it

amazing

[Music]

when frogs get older they breathe
through their lungs
so they can emerge from the water the
friendly little animals that we all know

[Music]

remember

this almost magical change is called
metamorphosis

by the way frogs have a superpower
because besides from breathing through
their lungs they can also breathe
through their skin

frogs

when they are older become carnivorous

they eat insects

small crustaceans spiders and small

lizards they are excellent hunters

because they have an incredible vision

they can see forward

backwards

and sideways all at the same time

as soon as they detect their prey they

throw their long sticky tongue and zap

they gobble it up

frogs are cold-blooded animals which means that their bodies have the same temperature as the water or air around them

they can adapt to any climate which is why there are frogs in all parts of the world

there are frogs

even in deserts

but despite being incredible survivors

frogs are in danger of extinction

yes

climate change pollution

droughts and the constant destruction of their habitats

means they are disappearing

that is why at happy learning we are

asking you to take care of nature

read watch videos and learn as much as

you possibly can so that all animals can

live in peace

and if frogs have been on this planet

for

140 million years

they can continue to jump from pond to

pond for another

140 million more goodbye friends

see you in the next video

[Music]
